

# **Advanced Database Management System**

**Lecture 11 – Sections 10.1-10.4  
Schema Design and Normalization**

# Designing Good Schemas

- We know how to create schemas, but ...
  - how do we create good schemas?
  - what does good mean?
- Schema quality measurements:
  - semantics of the attributes
  - minimal redundancy
  - minimal frequency of null values

# Clear Semantics

- Design schemas to be easy to understand
  - Each relation models a real-world entity type or relationship type (similar to a class)
  - Each tuple represents a real-world entity or a relationship between two entities
- Mixing unrelated information in the same relation is confusing
  - Avoid: “huh? why is this stored here?”
- Good names always improve clarity

# Clear Semantics

- Each tuple in a relation should represent one entity or relationship instance.
  - Attributes of different entity types (i.e. EMPLOYEES, DEPARTMENTS, PROJECTS) should not be mixed in the same relation
  - Only foreign keys should be used to refer to other entities
  - Entity and relationship attributes should be kept apart as much as possible.
- Bottom Line: Design a schema that can be explained easily *relation by relation*.  
The semantics of attributes should be easy to interpret.

If you started with a good ER design, you should have a clear relational schema.

# Reduce Redundancy

- If the same information is stored in multiple places, then extra work is required to ensure consistency
- We can reduce redundancy by splitting relations
  - keep the primary key in both new relations – join on PK to get back the original table when needed
- Redundancy leads to *update anomalies*
  - examples:
    - insertion: adding some info requires copying other info
    - deletion: removing some info cause unrelated info to be lost

# Update Anomaly Example

- Consider the relation:
  - EMP\_PROJ(EmpNum, ProjNum, Ename, Pname, NumHours)
- Update Anomaly:
  - Changing the name of project number P1 from “Billing” to “Customer-Accounting” requires an update for every employee who works on project P1.

# Insert Anomaly Example

- Consider the relation:
  - EMP\_PROJ(EmpNum, ProjNum, Ename, Pname, NumHours)
- Insert Anomalies:
  - Cannot insert a project unless an employee is assigned to that project.
  - Cannot insert an employee unless that employee is assigned to a project.

# Delete Anomaly Example

- Consider the relation:
  - EMP\_PROJ(EmpNum, ProjNum, Ename, Pname, NumHours)
- Delete Anomaly:
  - When a project is deleted, it will result in deleting all the employees who work (only) on that project.
  - When an employee is the sole employee on a project, deleting that employee results in deleting the corresponding project.

# Redundancy Example

- Where's the redundancy?

EMP\_PROJ

# Reduce Number of Null Values

- Null values should be used only for special cases
  - nulls should not be a "normal" value
- If some attributes are expected to frequently be null, move them to a separate relation
  - the new relation will only have tuples for the non-null cases
- Reasons for nulls:
  - Attribute not applicable or invalid
  - Attribute value unknown
  - Value known to exist, but it is currently unavailable

# **NORMALIZATION**

# Theory for Good Design

- Previous discussion introduced informal guidelines for good schema design
- Remaining discussion introduces a formal theory for achieving good designs
  - **Functional Dependencies:**  
determine "true" relationships between attributes
  - **Normal Forms:**  
define schemas in which the quality measurements are satisfied

# Example FDs

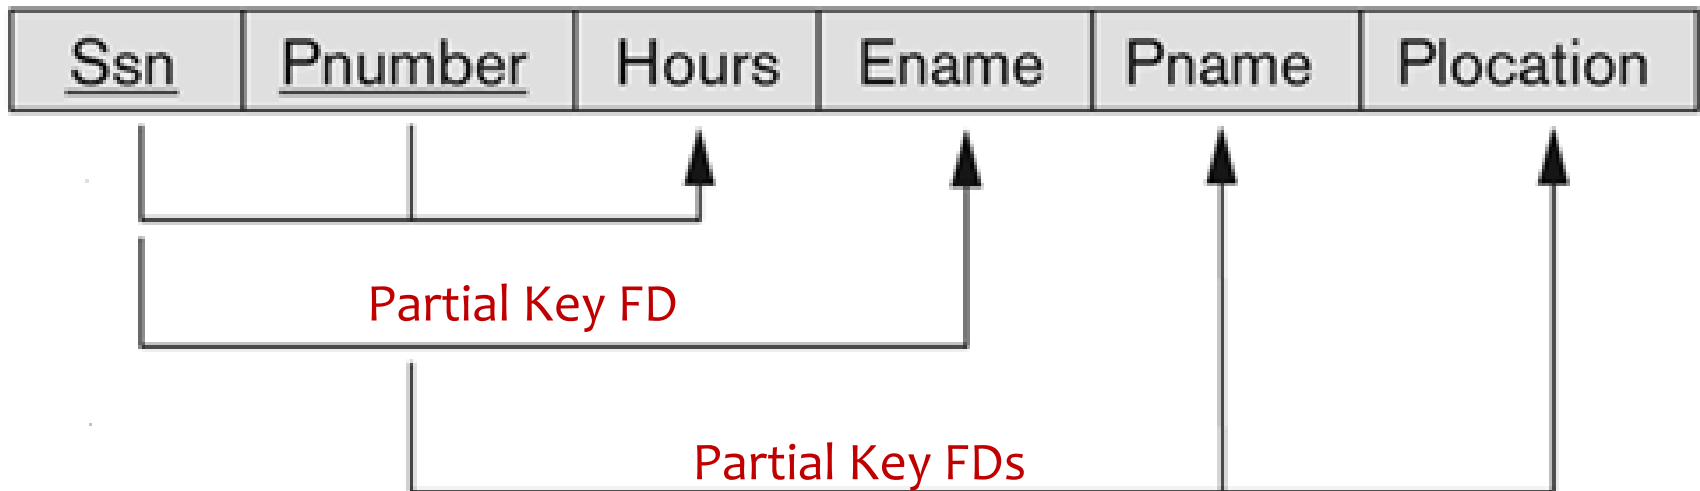

**EMP\_DEPT**

Proper FDs

Transitive FDs

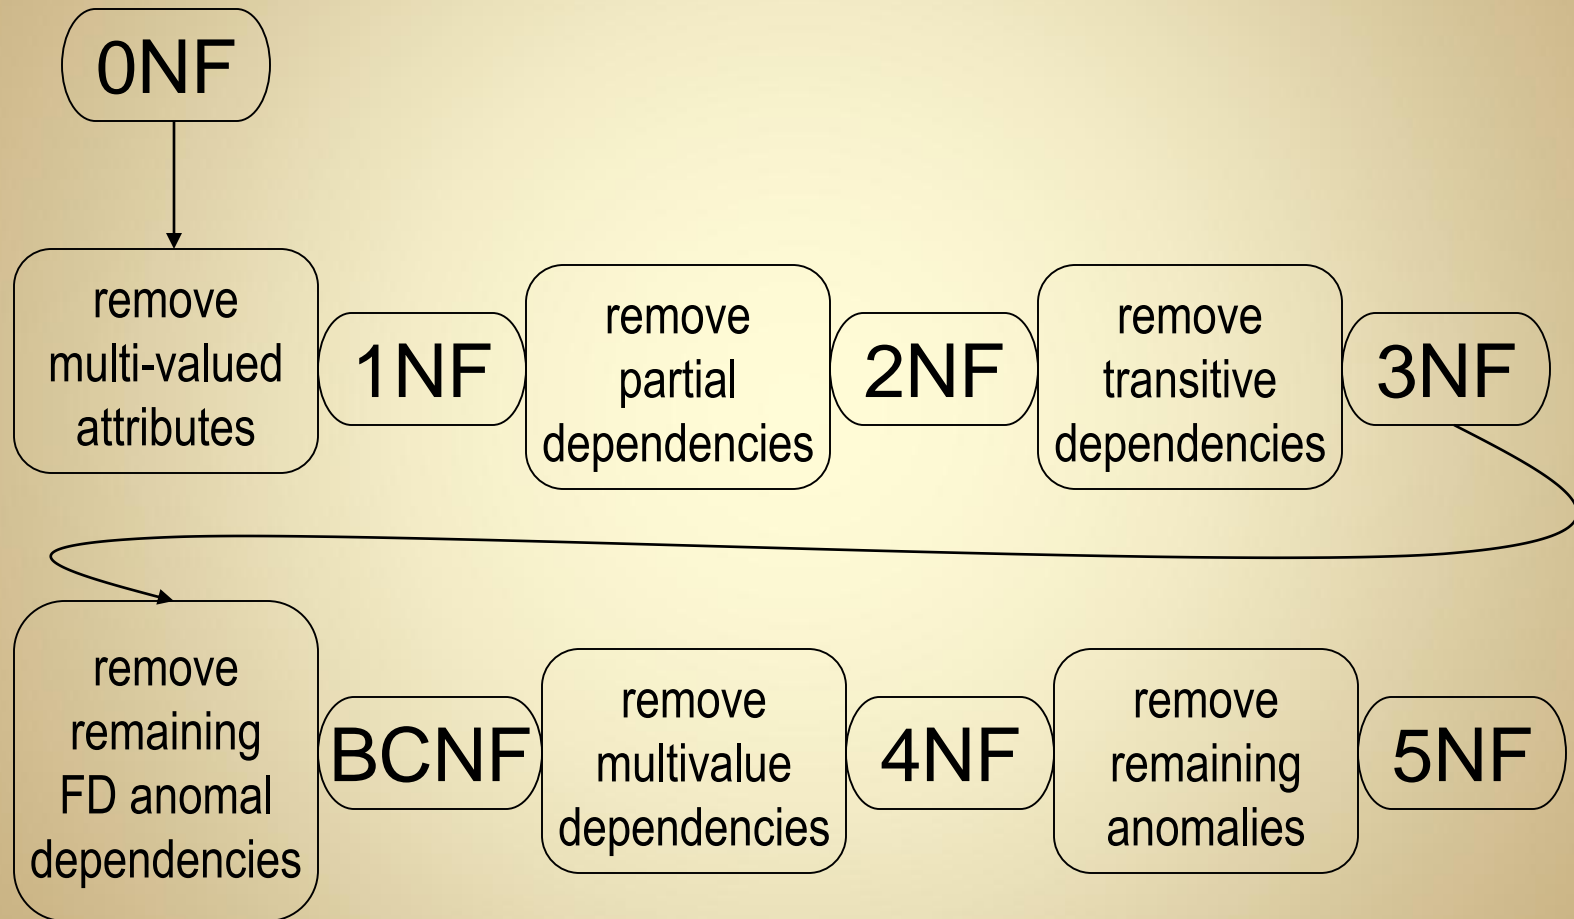

**EMP\_PROJ**

| Administration | 4              | 987654321 | Stafford         |
| Headquarters   | 1              | 888665555 | Houston          |

Proper translation from ER multi-value attributes will achieve 1NF.

Still not a good solution, since we have redundancy in Dnumber and Dmgr\_ssn. (This will be handled by 2NF.)

# FD: Formal Definition

- A *functional dependency* (FD) is a constraint between two sets of attributes
- Let  $X, Y$  be two sets of attributes, such that if  $t_1[X] = t_2[X]$  then  $t_1[Y] = t_2[Y]$ 
  - the value of  $X$  *determines* the value of  $Y$
  - there exists a function  $Y = f(X)$
- We denote FDs by
$$X \rightarrow Y$$

# Example FDs

(BLDG, ROOM) → (CAPACITY, NUM\_WINDOWS)  
proper FD

(THEATER, SCREEN, TIME) → (MOVIE)  
proper FD

(STORE\_ID, ITEM\_ID) → (QUANTITY\_STOCKED, STORE\_ADDRESS)  
partial key FD  
proper FD

(ISBN\_NUMBER) → (PUBLISHER, PUB\_PHONE, TITLE)  
transitive FD  
proper FD  
proper FD

# Partial Dependencies

- $X \rightarrow Y$  is a *partial dependency* (PD)  
if there exists  $X' \subset X$   
such that  $X' \rightarrow Y$
- PFDs lead to redundancy: there are multiple values of  $X$  that determine the same value of  $Y$
- 2NF normalization: move  $X'$  and  $Y$  to a new relation in which  $X'$  is the primary key

# 2NF Normalization

**EMP\_PROJ**

| <u>Ssn</u> | <u>Pnumber</u> | Hours | Ename | Pname | Plocation |
|------------|----------------|-------|-------|-------|-----------|
|------------|----------------|-------|-------|-------|-----------|

**2NF Normalization**

**EP1**

| <u>Ssn</u> | <u>Pnumber</u> | Hours |
|------------|----------------|-------|
|------------|----------------|-------|

**EP2**

| <u>Ssn</u> | Ename |
|------------|-------|
|------------|-------|

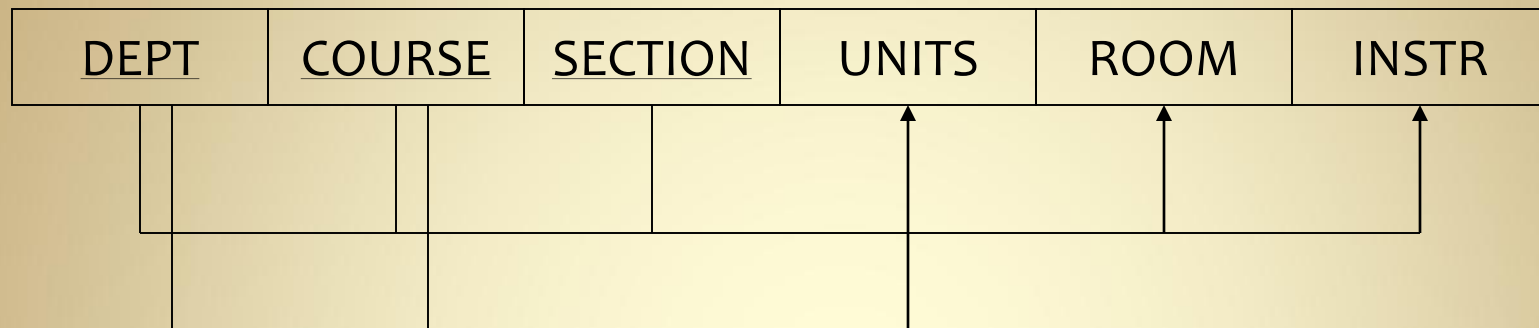

**EP3**

| <u>Pnumber</u> | Pname | Plocation |
|----------------|-------|-----------|
|----------------|-------|-----------|

Move the partial key and dependent attributes to a new relation.

# Partial Dependency Example

UNITS depends only on the partial key (DEPT,COURSE)

Following slides show update anomalies that will occur if we do not correct this problem.

# Insert Anomaly

| DEPT | COURSE | SECTION | UNITS | ROOM   | INSTR   |
|------|--------|---------|-------|--------|---------|
| COMP | 51     | 1       | 4     | WPC122 | DOHERTY |
| COMP | 51     | 2       | 4     | WPC219 | CLIBURN |
| COMP | 163    | 1       | 3     | WPC122 | DOHERTY |
| COMP | 53     | 1       | 4     | WPC130 | BOWRING |
| COMP | 53     | 2       | 4     | WPC130 | CARMAN  |

redundant information  
must be copied

insert into COURSES values  
("COMP", 51, 3, 4, "KNOLES210", "GAO")

# Insert Anomaly

| DEPT | COURSE | SECTION | UNITS | ROOM   | INSTR   |
|------|--------|---------|-------|--------|---------|
| COMP | 51     | 1       | 4     | WPC122 | DOHERTY |
| COMP | 51     | 2       | 4     | WPC219 | CLIBURN |
| COMP | 163    | 1       | 3     | WPC122 | DOHERTY |
| COMP | 53     | 1       | 4     | WPC130 | BOWRING |
| COMP | 53     | 2       | 4     | WPC130 | CARMAN  |

How do we add a course that currently has no sections?

```
insert into COURSES values  
("COMP", 179, NULL, 3, NULL, NULL)
```

nulls are not allowed  
in primary key

# Delete Anomalies

| DEPT | COURSE | SECTION | UNITS | ROOM   | INSTR   |
|------|--------|---------|-------|--------|---------|
| COMP | 51     | 1       | 4     | WPC122 | DOHERTY |
| COMP | 51     | 2       | 4     | WPC219 | CLIBURN |
| COMP | 163    | 1       | 3     | WPC122 | DOHERTY |
| COMP | 53     | 1       | 4     | WPC130 | BOWRING |
| COMP | 53     | 2       | 4     | WPC130 | CARMAN  |

What happens if the only section of a course is deleted?

```
DELETE FROM COURSES
WHERE DEPT = "COMP"
      AND COURSE = 163
      AND SECTION = 1
```

Course units information is also lost

# Update Anomaly

| DEPT | COURSE | SECTION | UNITS | ROOM   | INSTR   |
|------|--------|---------|-------|--------|---------|
| COMP | 51     | 1       | 4     | WPC122 | DOHERTY |
| COMP | 51     | 2       | 4     | WPC219 | CLIBURN |
| COMP | 163    | 1       | 3     | WPC122 | DOHERTY |
| COMP | 53     | 1       | 4     | WPC130 | BOWRING |
| COMP | 53     | 2       | 4     | WPC130 | CARMAN  |

What if we change the units for a course?

```
UPDATE COURSES
```

```
SET UNITS = 3
```

```
WHERE DEPT = "COMP" AND COURSE = 51
```

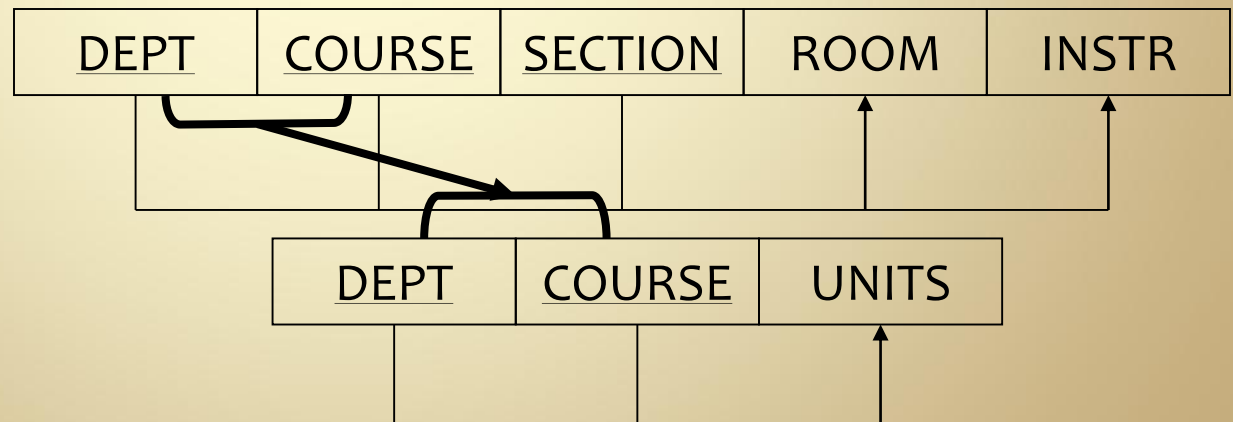

Must be careful to modify all sections

# NF Decomposition: Foreign Keys

- NF decomposition results in new foreign keys

Decomposition:

# 2NF Decomposition

| DEPT | COURSE | SECTION | UNITS | ROOM   | INSTR   |
|------|--------|---------|-------|--------|---------|
| COMP | 51     | 1       | 4     | WPC122 | DOHERTY |
| COMP | 51     | 2       | 4     | WPC219 | CLIBURN |
| COMP | 163    | 1       | 3     | WPC122 | DOHERTY |
| COMP | 53     | 1       | 4     | WPC130 | BOWRING |
| COMP | 53     | 2       | 4     | WPC130 | CARMAN  |

PDs are removed

anomalies  
are avoided

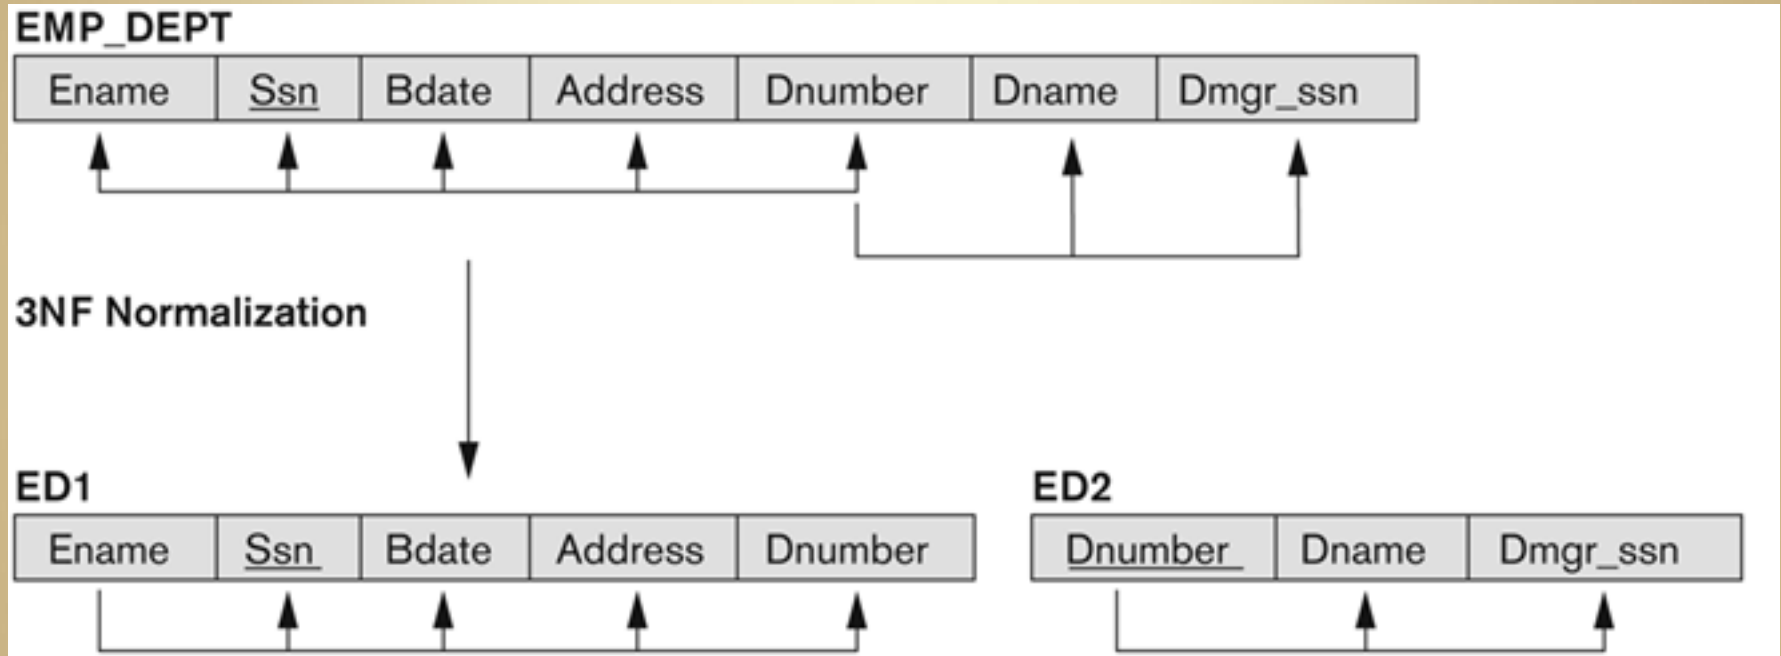

| DEPT | COURSE | SECTION | ROOM   | INSTR   |
|------|--------|---------|--------|---------|

| COMP | 53     | 1       | WPC130 | BOWRING |
| COMP | 53     | 2       | WPC130 | CARMAN  |

| DEPT | COURSE | UNITS |
|------|--------|-------|
| COMP | 51     | 4     |
| COMP | 163    | 3     |
| COMP | 53     | 4     |

# Transitive Dependencies

- $X \rightarrow Y$  is a *transitive dependency* (PD) if there exists  $Z \not\subseteq$  any key such that  $X \rightarrow Z \rightarrow Y$
- TDs can cause redundancy if there are multiple values of  $X$  that determine the same value of  $Z$ 
  - the value of  $Y$  for that value of  $Z$  is stored multiple times
- 3NF normalization: move  $(Z, Y)$  to new relation in which  $Z$  is the primary key

# 3NF Normalization

- Create new relation to hold the attributes in the transitive FD.
- LHS of transitive FD becomes PK of new relation.

# Transitive Dependency Example

I\_OFFICE (instructor's office) is determined  
by the non-PK attribute INSTR

| DEPT | COURSE | SECTION | ROOM   | INSTR   | I_OFFICE |
|------|--------|---------|--------|---------|----------|
| COMP | 51     | 1       | WPC122 | DOHERTY | CSB109   |
| COMP | 51     | 2       | WPC219 | CLIBURN | CSB107   |
| COMP | 163    | 1       | WPC122 | DOHERTY | CSB109   |
| COMP | 53     | 1       | WPC130 | BOWRING | CSB108   |
| COMP | 53     | 2       | WPC130 | CARMAN  | CSB104   |

# Normal Forms Defined Informally

- 1<sup>st</sup> normal form
  - All attributes depend on **the key**
- 2<sup>nd</sup> normal form
  - All attributes depend on **the whole key**
- 3<sup>rd</sup> normal form
  - All attributes depend on **nothing but the key**

# Further Normalization

- BCNF
  - based on keys and FDs of a relation schema
- 4NF
  - based on keys, multi-valued dependencies
- 5NF
  - based on keys, join dependencies
- Additional properties may be needed
  - lossless join, dependency preservation
- *For this course, we'll assume that 3NF is sufficient*

# Caution: False FDs

| <u>DEPT</u> | <u>COURSE</u> | <u>SECTION</u> | UNITS | ROOM   | INSTR   |
|-------------|---------------|----------------|-------|--------|---------|
| COMP        | 51            | 1              | 4     | WPC122 | DOHERTY |
| COMP        | 51            | 2              | 4     | WPC219 | CLIBURN |
| COMP        | 163           | 1              | 3     | WPC122 | DOHERTY |

| COMP        | 53            | 2              | 4     | WPC130 | CARMAN  |

(INSTR)  $\rightarrow$  (ROOM)?

No, it is only a coincidence that Doherty teaches both classes in the same room

# Determining FDs

- Functional dependencies are determined by the *semantics of the schema*, not by a particular database state (an FD is a *constraint*)
- A database state can prove that something is not an FD
- A database state can only indicate that something might be an FD

# Exercises

- Assume that the relation  $R(\underline{A}, B, C, D)$  is in first normal form.  
Is it possible that it is not in second normal form?  
Explain your answer.

# Exercises

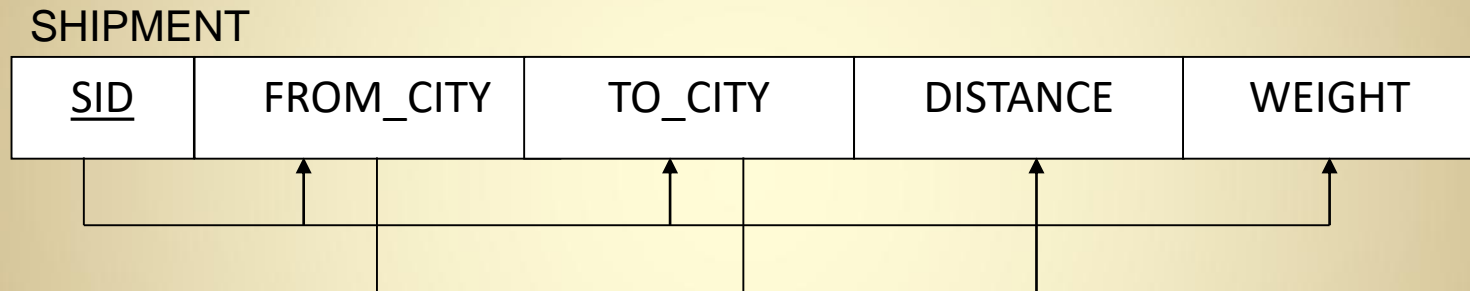

- The following instance of the relation  $T(\underline{U}, \underline{V}, W, X)$  indicates that there may be a functional dependency  $\{U\} \rightarrow \{X\}$ .

Add a tuple to the relation that would show that this is not a true functional dependency.

| <b>U</b> | <b>V</b> | <b>W</b> | <b>X</b> |
|----------|----------|----------|----------|
| 12       | 34       | 21       | 65       |
| 29       | 52       | 56       | 34       |
| 13       | 34       | 78       | 72       |
| 12       | 45       | 42       | 65       |
|          |          |          |          |

# Exercises

- The following relation schema is not in third normal form (3NF).

Is this an example of a *transitive dependency* or a *partial key dependency*?

Give an equivalent schema that is in 3NF.

# Exercises

- This relation has been proposed to track Pacific alumni:

Alumni( SID, LastName, FirstName, Degree, YearAwarded, Phone).

Pacific allows students to receive multiple degrees, possibly in different years.

Identify all FDs.

Give a new schema that is in third normal form.

# Exercises

- Consider the following relation schema:

Movie(title, genre, length, actor, sag\_id, studio, studio\_addr)

- Every movie has a unique title.
  - A movie may have multiple actors.
  - Each actor has a unique sag\_id.
  - An actor may appear in multiple movies.
  - A movie has exactly one studio,  
but a studio may produce more than one movie.
  - Each studio has exactly one address.
- Identify all functional dependencies.
  - Normalize the schema to 3NF.
