

# Digital Image Processing

## Lecture # 2B: Fundamentals

# Contents

## ◆ Image Interpolation

- Pixel Replication
- Pixel Decimation
- Nearest Neighbor Interpolation
- Comparison of Bilinear & Nearest Neighbor Interpolation

# Image Interpolation

- ◆ Image resizing
- ◆ Three methods

# Enlarging an Image

- ◆ Pixel replication

[1 2 3 4 5]

[1 1 2 2 3 3 4 4 5 5] (One step)

[1 1 1 2 2 2 3 3 3 4 4 4 5 5 5] (Two step)

# Enlarging an Image

Example:  
zoom this  
image 4x to  
get this  
image.

Start with a blank image 4 times the  
linear dimensions of the original.

Fill in every 4th pixel in every 4th  
row with the original pixel values.

# Enlarging an Image

Detail showing every 4th pixel in every 4th row with the original pixel values.

# Enlarging an Image

Replicate the values

# Reducing an Image

## ◆ Pixel Decimation

Example:  
decimate  
this image  
4x to get  
this image.

Decimation by  
a factor of  $n$ :  
take every  $n$ th  
pixel in every  
 $n$ th row

# Reducing an Image

# Reducing an Image

Example:  
decimate  
this image  
4x to get  
this image.

Keep every  
4th pixel in  
every 4th row

# Reducing an Image

Example:  
decimate  
this image  
4x to get  
this image.

ignore all  
the others

# Reducing an Image

# Nearest Neighbor Interpolation

The “Nearest Neighbor” algorithm is a generalization of pixel replication and decimation.

It also includes fractional resizing, *i.e.* resizing an image so that it has  $p/q$  of the pixels per row and  $p/q$  of the rows in the original. ( $p$  and  $q$  are both integers.)

# Nearest Neighbor Interpolation

Zoom in on a section for a closer look at the process

Example:  
resize to  $\frac{3}{7}$   
of the original

# Nearest Neighbor Interpolation

3/7 resize

Zoom in for a better look

# Nearest Neighbor Interpolation

3/7 resize

Outlined in  
blue: 7x7  
pixel squares

# Nearest Neighbor Interpolation

3/7 resize

In yellow: 3 pixels  
for every 7 rows,  
3 pixels for every  
7 cols.

# Nearest Neighbor Interpolation

3/7 resize

Keep the  
highlighted  
pixels...

# Nearest Neighbor Interpolation

3/7 resize

... don't keep  
the others.

# Nearest Neighbor Interpolation

3/7 resize

Copy them into  
a new image.

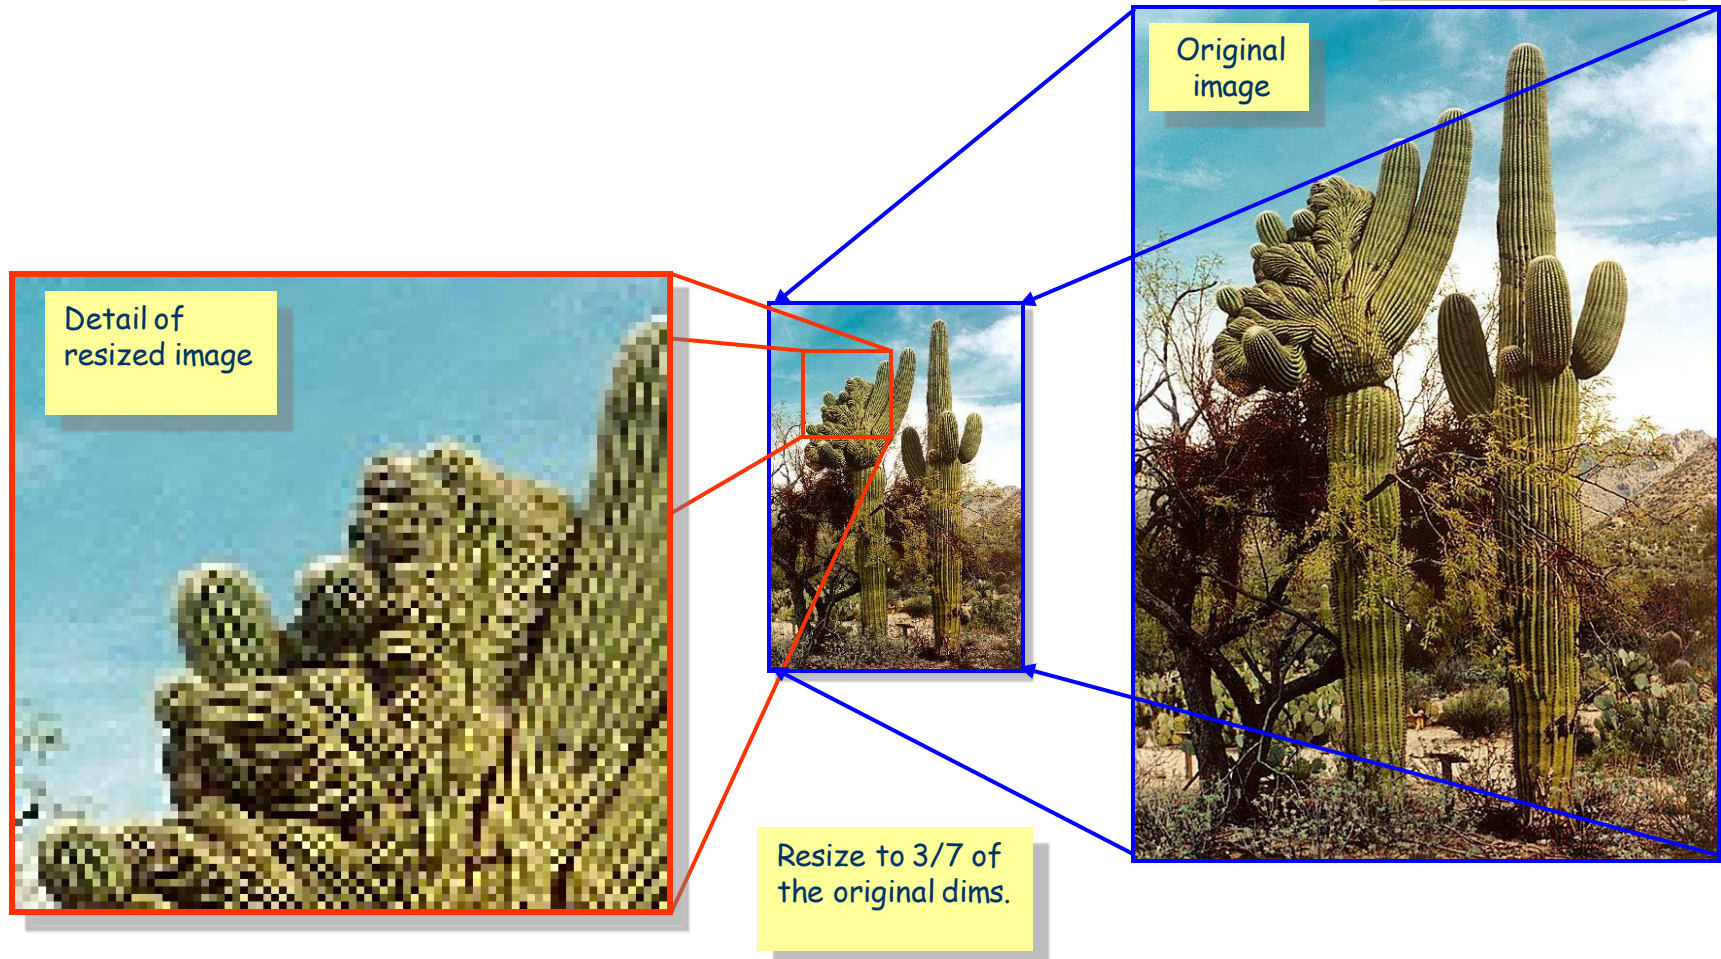

# Nearest Neighbor Interpolation

3/7 times the  
linear dimensions  
of the original

# Nearest Neighbor Interpolation

# Nearest Neighbor Interpolation

Original  
image

7/3 resize

Pixels spread out  
for a 7/3 resize ...

... then filled in.

# Nearest Neighbor Interpolation

7/3 resize

Each 3x3 block of pixels from here ...

... is spread out over a 7x7 block here

Original image

Detail

# Nearest Neighbor Interpolation

3x3 blocks  
distributed over  
7x7 blocks

7/3 resize

# Nearest Neighbor Interpolation

7/3 resize

Empty pixels filled  
with color from non-  
empty pixel

# Nearest Neighbor Interpolation

7/3 resize

Empty pixels filled  
with color from non-  
empty pixel

# Nearest Neighbor Interpolation

Original  
image

7/3 resized

# Image Interpolation

- ◆ Nearest neighbour interpolation
  - Simple but produces undesired artefacts
- ◆ Bilinear Interpolation

$$v(x, y) = \frac{1}{4} (v_{11} + v_{12} + v_{21} + v_{22})$$

- ◆ Bicubic Interpolation

$$v(x, y) = \sum_{i=0}^3 \sum_{j=0}^3 c_{ij} \phi_i^3(x) \phi_j^3(y)$$

# Interpolation: Comparison

We'll enlarge this image by a factor of 4 ...

... via bilinear interpolation and compare it to a nearest neighbor enlargement.

# Interpolation: Comparison

Original  
Image

To better see what happens, we'll look at the parrot's eye.

# Interpolation: Comparison

Pixel replication

Bilinear interpolation

# Interpolation: Comparison

Pixel replication

Bilinear interpolation
